

Job Application MCP — Quick Start

v0.4.0 · one-click setup · local-first · github.com/firyomaefx/job-application-mcp

You don't need to configure anything by hand. The app detects what's available and sets itself up with a single click.

① Install & open

Download the Windows installer (NSIS `.exe` or `.msix`) from the GitHub Releases page and run it — or, for the command line, `git clone` the repo, `npm install` , `npm run build` . Open the app; the local bridge starts automatically.

First run on Windows: the installer is currently *unsigned*, so SmartScreen warns. Choose *More info* → *Run anyway*. It's the genuine build — the warning is reputation, not malware.

② Click “Auto-configure & start”

On the *Setup & Status* card at the top of the dashboard, click the big button. The app:

- probes for a local **Ollama** model (fully offline, free, no key);
- if Ollama isn't running, checks whether you've previously set an AI key;
- otherwise falls back to the built-in **Mock** heuristic (offline, no key);
- applies the best option and confirms the bridge is up.

A green checklist appears showing the state of

Bridge · AI · Profile · CV

.

Bridge: ● running :8787 AI: ● Ollama (local) · up [Mock] [●Ollama] [My key] Profile: ● set CV: ○ none — [Import CV]

③ Change anything with one click

The same card has one-click

chips

to switch AI provider (Mock / Ollama / My key) — applied live, no restart. The collapsible *AI settings* form lets you set the

model

,

base URL

, and

API key

(your own OpenAI/Anthropic key, stored locally, masked, never uploaded). Use *Import CV* to parse a local PDF/DOCX/TXT, and *Set up profile* to add your name/skills.

Then what?

- **From an AI client** (Claude Desktop / Claude Code / Cursor): register the MCP server and just talk — “*parse my CV, analyze this job, tailor my CV for it.*” The `system_check` tool reports the same status the dashboard shows.
- **From the browser**: the Chrome extension detects job postings on LinkedIn/Indeed/Lever/Greenhouse/Workday/SmartRecruiters and imports them to your local inbox with one click.
- **Submission is always manual**: the app prepares and previews; *you* submit on the employer's site, then record it. Nothing is ever auto-submitted.

Everything stays on your machine

CVs, applications, reminders, and your AI key live under `JOB_MCP_DATA_DIR`. The bridge binds `127.0.0.1` only. The only outbound calls are to the AI provider *you* chose (your key or local Ollama) and, on packaged builds, a GitHub update check. No CV text or PII is ever uploaded or logged.
